The invention relates to antibodies, especially humanised antibodies (see AAW83031-37), recognising the Fas antigen. Such antibodies preferably comprise a heavy chain and a light chain including CDRs (see AAW8304-22) from the heavy and light chains of HFF7A. Humanised antibodies are produced by CDR grafting. The antibodies are capable of inducing apoptosis in abnormal cells expressing Fas, and of
                                            chain
3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. A light chaicaDNA clone was sequenced (AAQ83490) that encoded the protein given in AAR70189. 3 CDNS (AAR70195-97) were identified. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibodies and proteins bind conserved epitope of Fas antigen – usec
to evaluate drugs in animal models and to treat Fas-associated diseases
e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HFETA; monoclonal antibody; mouse; Fas; humanised antibody; apoptosis; autoimmune disease; Hashimoto's disease; systemic lupus erythematosus; graft versus host disease; Sjogren syndrome; pernicious anaemia; Addison's disease; scleroderma; Goodpasture syndrome; Crohn's disease; stervility; rheumatoid arthritis; autoimmune haemolytic anaemia; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; insulin-dependent diabetes; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerular nephritis; complementarity determing region; CDR.

             evaluate, in animal models, treatments off diseases that involve Fas/Fas autoimmune disease (e.g. systemic lupus erythematosus, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohm's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocalcinis, cardiomyophathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed). (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA molecules encoding recombinant antibodies useful for treating IL4-mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin B-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic aesthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a complementarity determining region (CDR) of the light chain variable region of murine interleukin-4 (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allorgic reactions e.g. allergic rhintis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock,
                                                                                                                                                                                                                                                                                                             Gaps
inhibiting Fas-induced apoptosis in normal cells. They are used to
                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a light chain complementarity determining region (CDR) from an antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft
rheumatoid arthritis, host-vergus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived complementarity determining region CDR-1 protein fragment which is used to illustrate the method of the invention
                                                                                                            separation; antibody; CD4; CD34; leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autolmmune diseases, contains anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFB7A, or a humanised version of HFB7A containing identical CDRs (complementarity determining regions) to antibody HFB7A. Via its interaction with Fas, the antibody of the invention as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (pammyelophthiais), hepatitis, AIDS and organ graft rejection. Sequences AAB14744-B14746 represent CDRs 1-3 of the light chain of the murine anti-human Fas monoclonal antibody HFB7A, which is produced by hybridoma HFB7A (FERM-BP-5828)
                                                                                                                                                                                                                                                                                                                                           Anti-Fas antibody; monoclonal antibody HFE7A, FERM-BP-5828; muxine; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

capoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,
anti-anemic, antidiabetic, anti-allergic, anti-arthritic, anti-inflammatory,
immunomodulatory, dermatological, immunosupressive, thyromimetic,
antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosclerctic, cardiant and hepatropic activity. (I) induce
antiarteriosclerctic, cardiant and hepatropic activity. (I) induce
capptosis by binding to cell surface Fas or inhibit it by competitive
continuous of ligand binding. (I) are used to treat and/or prevent
cliesases associated with the Fas/Fas ligand system, especially systemic
clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
cversus host disease, Slorgan's syndrome, pernicious or hypoplastic
anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolyric anemia, sterility, myasthenia gravis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
cdependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
corrections of the server of the active site of Fas, i.e. they minic
cells. They bind to both human and eactive site of Fas, i.e. they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. Sequences AAYS5259-61 represent the complementarity determining region (CDR)-1, 2 and CDR-3 fragments in the L chain variable region of the antibody respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; mouse; Fas/Fas ligand system; Fas; antibody; light chain; heavy chain; apoptosis; antiallergic; immunosuppressive; apoptotic; autoimmune disease; allergy; atopy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drug for preventing or treating e.g. autoimmune disease or allergy, comprises humanized anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                          ö
                        The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a peptide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all specifically with mammalian Fas and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic allergy, acopy and others. The present sequence is that of a peptide, useful to the invention
                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drug containing humanized anti-Fas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, mouse, humanised anti-Fas antibody, Fas/Fas ligand,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a chemokine construct comprising scFV anti-CD4 and a RANTES chemokine or their fragments. Sequences of the invention are useful for preparing a pharmaceutical composition for treating human immunodeficiency virus (HIV) -infection or acquired immune deficiency syndrome (AIDS) or inflammatory and/or autoimmune diseases. They are used as vaccines and in gene therapy. The present sequence is MT413 modified VL protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chemokine,
 The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the L chain variable region of the antibody 4H5
                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New chemokine construct comprising scFV anti-CD4 and a RANTES chemoki
useful for the preparing a composition for treating HIV-infection or
inflammatory or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                 differentiation (CD)-positive cells using a recombinant (Chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate
                                                                                                                                                                                                                                                                                  Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel device (I) for separating cluster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This sequence represents the light chain amino acid sequence of a mouse anti-human immunoglobulin E (IgE) antibody. The invention relates to a bispecific antibody that binds specifically to IgE when IGE is bound to its low affinity receptor (FCEL), but does not bind to IgE, when IGE is bound to its high affinity receptor (FCEH). The bispecific antibody comprises an IGE-binding arm with human framework residues of a recipient human antibody and donor murine CDR (complementarity determining region) residues, but with at least one human CDR residue replacing the analogous murine residue. The antibody also comprises an FV that is specific for a predetermined antigen other than IGE. The antibodies work by displacing bound IGE from its receptor, or via competitive inhibition of its binding. The bispecific antibodies are used for diagnosis, treatment and prevention of allergy and other IGE-mediated diseases, also, when immobilised, for the isolation of FCEL from cells (for research or therapy). The bispecific antibodies of the invention do not cause granulation or release of histamine from mast cells
                                                                                                                                                                                                                                                                           New bispecific antibodies, useful for treating immunoglobulin E-mediated disease, binds to IgE, but only when on the low affinity receptor, and to an antigen other than IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 79; DB 3; I

The heavy and light chain variable regions from these antibodies were sequenced (AAR55120-R55123). The murine anti-HIV CDRs were introduced into human framework regions to construct chimeric antibodies (AAR55124-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chimeric anti-HIV antibody heavy and light chains - and antibody consisting of the H- and L-chains, useful in AIDS

The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic astima, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The present sequence represents the light chain variable region of Ig REI, and is used in the course of the

They can be used for treating a disorder mediated by IgE such as hypersensitivity, actor, allergy, asthma, allergic rhinitis, conjunctivitis, hay fever, eczema, anaphylactic shock and urticaria. The antibodies can also be used for affinity purification, detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                             Improving affinity of polypeptides, particularly anti-IgE antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the

The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin B (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
allergic disorder, allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma; anaphylactic shock, cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoglobulin B; IgB; anti-human IgB; bispecific antibody; FCEL; FCEH; low affinity binding receptor; high affinity binding receptor; allergy; diagnosis; treatment; histamine release; prevent; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the light chain of the humanised 3B9 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant IL4 antibodies useful for tratment of allergic rhinitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a muxine derived protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cluster differentiation; cell separation; antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                              Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 111;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                  anti-human immunoglobulin E (1gE) antibody. The invention relates to a bispecific antibody that binds specifically to IgE when IgE is bound to its low affinity receptor (FCEL), but does not bind to IgE; when IgE is bound to its low affinity receptor (FCEH). The bispecific antibody comprises an IgB-binding arm with human framework residues of a recipient human antibody and donor murine CDR (complementarity decermining region) residues, but with at least one human CDR residue replacing the analogous murine residue. The antibody also comprises an Fv that is specific for a predetermined antigen other than IgE. The antibodies work by displacing bound IgE from its receptor, or via competitive inhibition of its binding. The bispecific antibodies are used for diagnosis, treatment and prevention of allergy and other IgE-mediated diseases, also, when the isolating of FCE from cells (for research or therapy). The bispecific antibodies of the invention do not cause granulation or release of histamine from mast cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                          New bispecific antibodies, useful for treating immunoglobulin E-mediated disease, binds to IgE, but only when on the low affinity receptor, and to an antigen other than IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cluster differentiation, cell separation, antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
                                                                                                                                                                                                                                                                                                                  This sequence represents the light chain amino acid sequence of a mouse

                                                                                                                                                                                                                                                                                                                                                                                              The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents a L chain fragment of the antibody 4H5.

This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgE antibody activity. The antibody has improved action due to a process comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgE (immunoglobulin E) antibody; b) substituting alternative residues to create candidate molecules, and c) selecting those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiasthmatic; antiallergic; ophthalmological; dermatological and antiinflammatory antiallergic; ophthalmological; dermatological and antiinflammatory cativity. The antibodies are useful for treating IgE-mediated disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned on classific acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Amino acid sequences AAB76926.

AAB76960 represent fragments of anti-IgE antibodies of the invention. Polymucleotide sequence AAF69253 represents an expression plasmid used in the generation of affinity improved anti-IgE antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding anti-immunoglobulin E antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin E prone to isomerization by other residues by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the murine MaB11 light chain variable region protein.
                                                        Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibody or its antigen-binding fragment specific to a vertebrate high mobility group box (HMGB) A box that inhibits release of a proinflammatory cytokine from a cell treated with HMGB protein, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chemotherapy, IgE-mediated disorder; asthma; allergic rhinitis; eczema; urticaria; food allergy; hypersensitivity; anaphylactic hypersensitivity; antiasthmatic; antiallergi; dermatological, antibacterial; immune disorder; inflammation; ear disease; nose disease; throat disease; respiratory disease; antiinflammatory; dermatological disease;
                                                                                                                                                                                                                                                                                          New composition of an improved anti-IgE antibody or IgE binding fragment, useful for treating IgE-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to therapeutic compositions comprising anti-IgB antibody or IgB binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgB-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity as thins, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is murine anti-human IgB mAb MaEll variable light chain domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention provides antibodies, or their antigen-binding fragments, that bind to a vertebrate high mobility group box (HMGB) polypeptide, to methods of detecting and/or identifying an agent that binds to an HMGB polypeptide, methods of treating a condition in a subject characterized by activation of an inflammatory cytokine cascade, and methods of detecting an HMGB polypeptide in a sample. The antibody (or antigenbinding fragment) binds to a vertebrate HMGB A box but does not specifically bind to non-A box epitopes of HMGB, and inhibits release of a proinflammatory cytokine from a vertebrate cell treated with an HMGB protein. A method of treating a condition characterized by activation of an inflammatory cytokine cascade comprises administering an antibody of the invention, or its antigen-binding fragment. The condition is selected from sepsis, allograft rejection, arthritis, asthma, lupus, adult respiratory distress syntomic obstructive pulmonary disease, solutionistis, peritonitis, burns, ischemia, Behcet's disease, graft versus host disease, inflammatory bowel disease, multiple sclerosis and cachexia, especially sepsis, arthritis, astem multiple sclerosis and cachexia, especially sepsis, arthritis, or lupus. The present sequence is that of the A box of human HMGB1. An identical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antibody (I) capable of binding human benderite (TCAM)-3 grabbing non-tintegrin (DC-SIGN) or recognizing a DC-SIGN receptor on a cell, comprising an amino acid sequence having at least 80% homology to any one of 18 fully defined 4-10 amino acid sequences (ABB21889 to ABB2189). An antibody (I) capable of binding human DC-SIGN or recognizing a DC-SIGN receptor on a cell, is chosen from an antibody (A1) capable of binding human DC-SIGN or accognizing a DC-SIGN antibody (A2) capable recognizing a DC-SIGN receptor on a cell; and an antibody (A4) capable recognizing a DC-SIGN receptor on a cell. A4 effectively blocks binding of a virus to the cell, blocks infection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibody; DC-SIGN; dendritic cell-specific ICAM-3 grabbing non-integrin; cancer; neoplasm; cytostatic; inflammation; antinflammatory; ectoparasite infection; antiparasitic; infection; viral infection; bacterial infection; antibacterial; virucide; autoimmune disease; immunosuppressive; immune disorder; allergy; antiallergic; immunotherapy; transplant rejection; humanized antibody; single chain antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antibody capable of binding or recognizing human dendritic cell-specific intercellular adhesion molecule-3 grabbing non-integrin receptor on cell, useful for treating cancer, and viral and bacterial infections.
                                                                                                                                The anti-
                                                                                                                                                    늉
               New recombinant modified anti-HIV antibodies - comprise human {\bf x} mouse modified antibody H and L chains.
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                            CDRs are mouse monoclonal antibody 0.5beta derived sequences. The an HIV modified antibody can be used for the prophylaxis and treatment
                                                                                                            framework regions (FR) are derived from the human antibody REI.
                                                                                                                                                                   AIDS. Specific examples of the H chain are given in AAR24556-58 and AAR24560-62. A specific example of the L chain is given in AAR24575

Central involves administrating the immune response, which involves administering immune-modulating an immune response, which involves administering immune-modulating an an immune response, which involves administering immune-modulating an an immune of (I), to a subject. It is useful for displaying the antigen to (D.-SIGN expressing cells, which involves attaching the antigen to (D.-SIGN expressing cells, which involves concern increase sample from a subject suspected of having cancer, and determining the degree to which the tissue sample binds with (I), where an increase in the degree of binding compared to corresponding concern increase in the degree of binding compared to corresponding concern increase in the degree of binding compared to corresponding concern or inflammatory diseases. (I) is useful for blocking binding of a virus, bacteria or parasite to the cell, blocking infection of the cell by a virus, bacteria or parasite from the cell, to another cell, where the virus, bacteria or parasite from the cell to another cell, where the circus is chosen from Huy, HCV, Ebola, SRRS, CMV, Sindbis and Dengue, the Cancer is chosen from Huylori, K. Eneumoniae, M. Luberculosis and M. Bovis, and the parasite is chosen from Lipifanoi and S. mansoni. (I) is constant in traesting autoimmune diseases (e.g., rheumacoid arthritis; constant in traesting autoimmune diseases (e.g., rheumacoid arthritis). Composite the parasite is chosen from Leishmania pictures. It is no monther real, where the backets is chosen from Leishmania pictures. Bylori, Klebsiella pneumoniae, Mycobacterium tuberculosis and M. bovis, and the parasite is chosen from Leishmania picanoi and Schistosoma comprising Al and a carrier; a diagnostic agent [11] for a tumor comprising Al and a carrier; a diagnostic agent [11] for a tumor comprising Al and carrier; a diagnostic agent for treating (1); a characterized by increased DC-SIGN expression, comprising (1); a cancer, involves administering to a subject, a cancer cell killing cancer, involves administering to a subject, a dendritic cell killing amount of a composition comprising Al, and treating (MZ) an inflammatory disease, which involves administering to a subject, a dendritic cell killing amount of a composition comprises a natigen comprises a cancer antigen. Al is humanized antibody or an scPv. The amino acid sequence appears in the heavy chain CDR3 of the antibody. The amino acid sequence appears in the heavy chain CDR3 of the antibody or the light chain CDR3 of the antibody. A capable of blocking and crammitting virus, also binds to L-SIGN. (1) is useful in interfering with the interaction of DC-SIGN expressing cells and ICAM-expressing cells, which involves administering immune-modulating amount of (1), to a minimal of (1), to a minimal of (1) is useful in interfering minimal of (1) is useful and involves administering immune-modulating amount of (1), to a minimal of (1) is useful and ICAM-expressing cells, which interaction of DC-SIGN expressing cells, and ICAM-expressing cells, which interaction of (1) is useful in interfering minimal or to another cell, where the virus is chosen from HIV, hepatitis C virus (HCV), Ebbla, severe acute respiratory syndrome (SARS), cytomegalovirus (CMV), Sindbis and Dengue, or effectively blocks binding of a bacteria or parasite to the cell, blocks infection of the cell by a bacteria or parasite, and/or blocks transmission of a bacteria or parasite from the cell to another cell, where the bacteria is chosen from Helicobacter systemic lupus erythematous, multiple sclerosis), preventing transplant rejection, preventing and treating allergies, and to prevent, inhibit or at least delay T cell activation for alowing the onset and/or the progress of a viral disease such as HIV. (I) is useful in inducing the cell by a virus, and/or blocks transmission of a virus from the cell dendritic cells and/or their function and interaction, studying immune system and for detecting dendritic cells and/or C-type lectins in tolerance, immunotherapy, and in diagnostic and research for studying The present sequence represents a human DC-SIGN antibody, light chain, SEQ ID NO:44.

Monoclonal antibody ST40 light chain. XXXXXXXXX

```
The present sequence was used in a method for designing a mimetic which exhibits an activity associated with a parent molecule. Such mimetics may be smaller than the parent molecule and correspondingly easier and cheaper to make, since the active region of the parent molecule is normally relatively small. The method is useful where the parent molecule is a binding domain or the hypervariable region of an antibody or other member of the immunoglobulin superfamily. It is useful when the parent molecule is an antibody and the mimetic a peptide, especially an antibody which binds CD4. The mimetics designed and produced are useful diagnostically to detect cells bearing CD4 on their surfaces or may be included in pharmaceuticals e.g. to treat conditions in which CD4 is implicated (e.g. HIV)
                                                                                                                                                                                                                                                                                                                                                    Designing molecular mimetics to mimic a parent molecule activity, useful e.g. therapeutically and diagnostically, uses computational screening to identify active chemical groups by accessibility within the parent

This invention relates to a novel humanised antibody or antibody fragment which binds to an epitope on an envelope glycoprotein of the Venezuelan dequine encephalitis virus, and comprises at least one complementary determining region (DRN) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralising viral infection. The present sequence is that of a HY4 26 light chain protein which was used in the exemplification of the invention.
                                                                                                                                                  New humanized antibody or antibody fragment comprising at least one complementary determining region from a non-human antibody and at least one framework region from a human antibody, useful for preventing viral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for producing antibody enzymes comprising a structural analysis step which confirms the existence in the predicted stereostructure of the antibody based on its amino acid sequence of a catalytic triplet residue structure in which a serine residue, an aspartic acid residue, and a histidine or glutamic acid residue are located sterically close to one another. An enzyme produced by the method of the invention has virucide, anti-HIV, cycostafic, and antibacterial activity. The enzyme acts as a helicobacter pylori urease inhibitor, or chemokine receptor CCR-5 (HIV target) antagonist. The method of the invention is useful for the treatment, prevention and diagnosis of cancer and infectious diseases, especially infection by Helicobacter pylori or HIV. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                     Screening potential antibody enzymes by identification of a catalytic triplet residue in the stereostructure for production of antibody enzymes as diagnostic and therapeutic agents for cancer and infectious diseases including HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Virucidal antibody-related HY4 26a light chain protein sequence SeqID91.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        humanised antibody; epitope; envelope glycoprotein; Venezuelan equine encephalitis virus; complementary determining region; Venezuelan antibody; framework region; virucide; vaccine; viral infection; HY4; light chain.

This invention relates to a novel humanised antibody or antibody fragment
                       which binds to an epitope on an envelope glycoprotein of the Venezuelan equine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralisating viral infection. The present sequence is that of a human 38404 HV4 light chain protein which was used in the exemplification of the invention.

New humanized antibody or antibody fragment comprising at least one complementary determining region from a non-human antibody and at least one framework region from a human antibody, useful for preventing viral Infection.

Example; SEQ ID NO 93; 70pp; English.

This invention relates to a novel humanised antibody or antibody fragment which binds to an epitope on an envelope glycoprotein of the Venezuelan dequine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralising viral infection. The present sequence is that of a HY4 26 light chain protein which was used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel humanised antibody or antibody fragment which binds to an epitope on an envelope glycoprotein of the Venezuelan dequine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralising viral infection. The present sequence is that of a HY4 26 light chain protein which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized antibody or antibody fragment comprising at least one complementary determining region from a non-human antibody and at least one framework region from a human antibody, useful for preventing viral
                                                                                                                                                                                                                                                                   Virucidal antibody-related HY4 26c light chain protein sequence SeqID95

GPGR is a portion of HIV-1 gpl20 or gpl60 protein. Monoclonal antibodies (MAbs) that react with this and which have the capacity to neutralise the infection of H9 cells in culture by live HIV-1 strains Mn and IIIB are claimed. Specifically illustrating the invention are the murine MAD (claimed. Specifically illustrating the invention are the murine MAD (claimed. Specifically illustrating the invention are the murine MAD (claimed. Specifically illustrating the invention are the murine MAD (claimed. Specifically illustrating the invention are the wariable cregions of the heavy and light chains of MAD NM-01 were cloned by FCR (using cDNA generated from hybridoma HB 10726 cytoplasmic RNA as template. The DNA was then sequenced. The DNA and deduced AA sequences are given in AAO56688/R48616. The heavy chain variable region of NM-01 differs from AAO56688/R48616. The heavy chain variable region of NM-01 differs from the contact of 120. The light chain variable regions of these two Abs differ by contact of 120. The light chain variable regions of these two Abs differ by CC 3 AAs. Significantly, the three CDRs in the heavy chain (V-H) of the NM-CC HATOS while the sequences of the three CDRs in the light chain (V-L) cvary by about 29-41% compared to NM-01. (Updated on 25-MAR-2003 to
                                                                                                                          New humanised antibody specific for epitope on HIV-1 gp 120 - able to neutralise infection of HG cells, also nucleic acid encoding it, useful for passive immunisation to treat or prevent HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matsushita S, Hattori T;

A humanized antibody light chain variable region and signal sequence is given in AAR75155. The signal sequence is also provided in AAR70194. The sequences of the 3 CDRs are identical to mouse anti-human II-4 MAD 3B9 light chain CDRs (given in AAR70195-97). (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                               A humanized antibody light chain variable region and signal sequence is given in AAR75355. The signal sequence is also provided in AAR70194. The sequences of the first 2 CDRs are identical to mouse anti-human IL-4 MAb 3B9 light chain CDRs (given in AAR70195-96), but the third (AAR70201) differs by a single amino acid from the native mouse CDR (AAR70197). (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents the light chain variable region of a humanised murine interleukin-4 (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The coefficient of the invention are used in therapeutic and pharmaceutical antibodies of the invention are used in therapeutic and pharmaceutical altergic reactions e.g. allergic rehinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA molecules encoding recombinant antibodies useful for treating IL4 -mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic aethma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
This sequence represents the light chain of the humanised 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic cathma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                            Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                    humanised murine interleaking for antibody 389. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                       New DNA molecules encoding recombinant antibodies useful for treating IL4 -mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allaregic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.

A,Cromment: This chain was isolated from a myeloma protein.
C;Comment: This chain was isolated from a myeloma protein.
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kag hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into le C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords heterotetramer
F;16-94/Domain: immunoglobulin homology <IMM>
F;23-92/Disulfide bonds: #status predicted
